

Your Wi-Fi network is shared among all devices in your home

The more devices connected to your Wi-Fi network, the bigger the demand on the network and the greater effect this has on speeds to your devices.

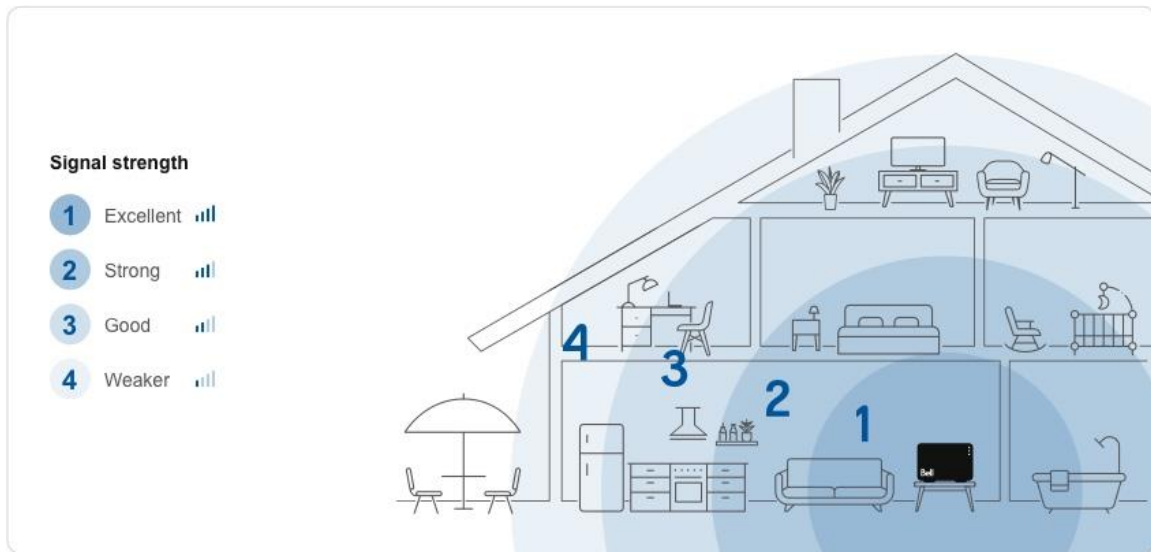

Higher-speed Internet packages deliver better Wi-Fi to many devices.

How the distance from your modem affects signal strength

Wi-Fi signal strength is strongest close to the modem, as shown in the image below. As Wi-Fi radio waves travel from the modem, they are affected by:

- Distance from the modem
- Obstructions such as walls, furniture, etc.
- Signal interference from other electronics (small appliances, microwaves, etc.)

To improve your device's Wi-Fi speed, Wi-Fi Pour améliorer la portée de votre signal,

- Remove objects around the modem that could obstruct the signal (cabinets, boxes, etc.).
- We recommend adding a signal booster or mesh Wi-Fi coverage device to extend the Wi-Fi signal range indoors. Signal extenders are available from Maskatel at a price of \$5/month per device.
